TrackTools V2.1.1 Release Notes

Changelog:

TT_NodeGroups.blend

TERRAIN_SHAPE modifier

- Improved cutter functionality
- Fixed geometry sticking through road when not using cutter

TERRAIN_GEOMETRY modifier

- Improved subdivision around tunnel mesh

TERRAIN_SIMPLE modifier

- Fixed issue where parts of the extruded road mesh were sometimes not removed properly

EDGE modifier

- Fixed edgeID attribute not being stored properly on the edge mesh, which caused TERRAIN_SHAPE edge index filter to not work correctly

TT_assets.blend

- Tree collections and prefabs renamed for consistency
- Tree prefab asset previews reassigned correctly (previously had switched images)

TT_tutorial.blend

- Updated screenshot of TERRAIN_SHAPE inputs

TT_startup_scene_simple.blend

- Collection (asset) renamed from startup_scene_02 to startup_scene_simple

Important Update: File Naming Structure Change

I need to apologize for an oversight in V2.1's initial release.

When I released V2.1, I included version suffixes in all the internal filenames (TT_assets_v2.1, TT_NodeGroups_v2.1, etc.) AND in the folder name. I didn't realize at the time that this would create a problem: every time I release a hotfix or update, you'd have to manually relink all your asset libraries in every single project you've created.

Starting with V2.1.1, I'm fixing this by removing version numbers from both the internal files AND the main folder. The folder will now simply be named TrackTools_FULL (or BASIC/FREE depending on your pack). To check which version you have, there's a text file inside called version_2.1.1.txt (or whatever version you downloaded).

This means that for all future updates, you'll simply replace the folder contents and everything will continue working automatically - no relinking required.

I know this requires one manual relink now, but this one-time adjustment will save you (and me) countless hours of frustration with every future hotfix and smaller updates.

How to Update from V2.1 to V2.1.1

Step 1: Replace Your Files

- Download TrackTools_[PACK]_v2.1.1.zip
- Extract it - you'll notice the folder is now named just TrackTools_FULL (or BASIC/FREE)
- Delete your old TrackTools_v2.1_PACK] folder
- Move the new TrackTools_[PACK] folder to the same location where your old one was

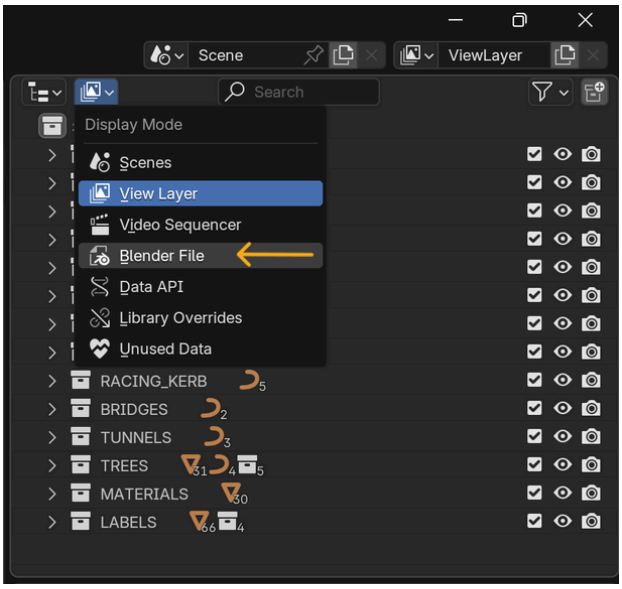

Step 2: Update Your Asset Library Path

- Open Blender Preferences (Edit > Preferences)
- Go to File Paths tab
- Find your TrackTools library in the Asset Libraries section
- Click the folder icon next to the old path
- Navigate to your new TrackTools_[PACK] folder
- Select it and confirm
- Save Preferences

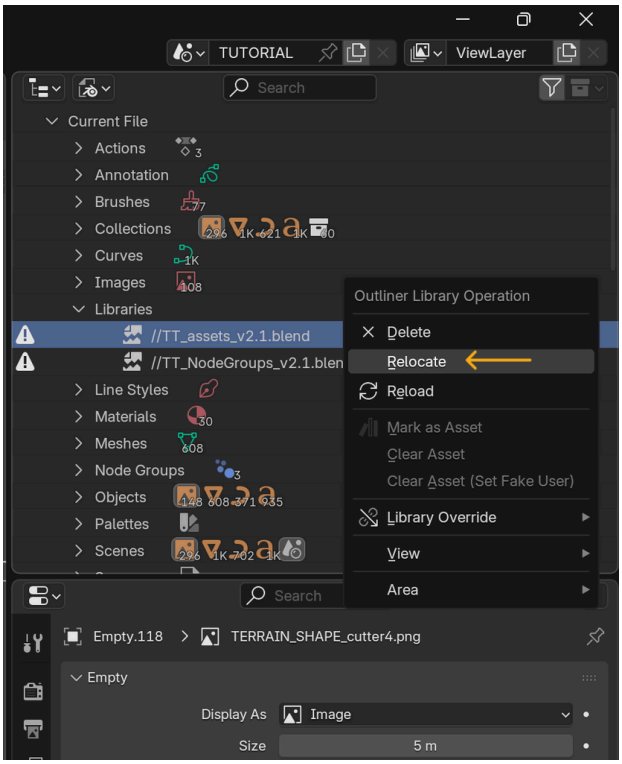

Step 3: Relink Libraries in Your Existing Projects

For each project file you've created with V2.1:

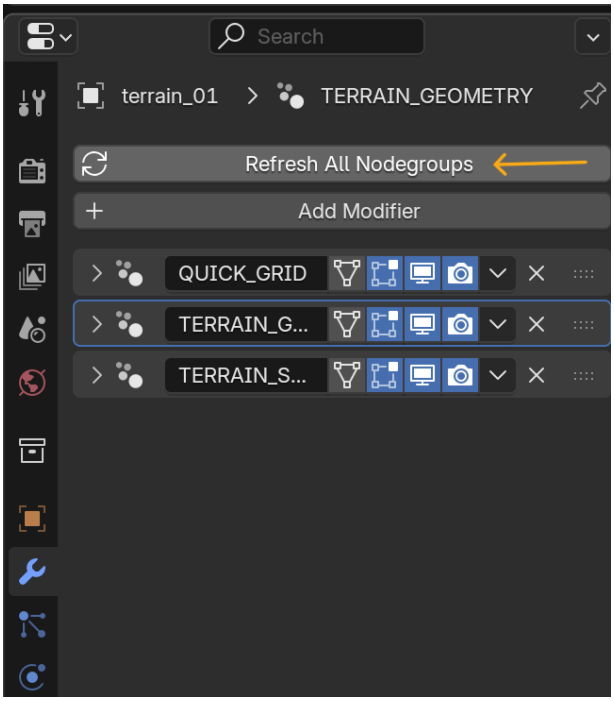

- Open your project file
- Open the Outliner and switch to "Blender File" display mode.

- Relink the libraries:
- Look for broken library links with warning icons (you might see TT_NodeGroups_v2.1 and/or TT_assets_v2.1)
- Right-click on each broken library and select Relocate

- Navigate to your TrackTools_[PACK] folder and select the corresponding file without version suffix:
  - TT_NodeGroups.blend
  - TT_assets.blend
- Confirm for each one
- Refresh all NodeGroups (**IMPORTANT!**):
- If you have the Asset Browser Link addon installed, go to the modifier properties tab and click the Refresh NodeGroups button.

- If you don't have the addon, you'll need to manually update any modified NodeGroups in your scene
- Save your project

Everything should now work correctly with the new file structure!

If you run into any issues during this transition, please reach out on Discord.
