TrackTools - Installation & Setup Guide

Welcome to TrackTools! This guide will walk you through everything you need to get started with creating roads or tracks in Blender.

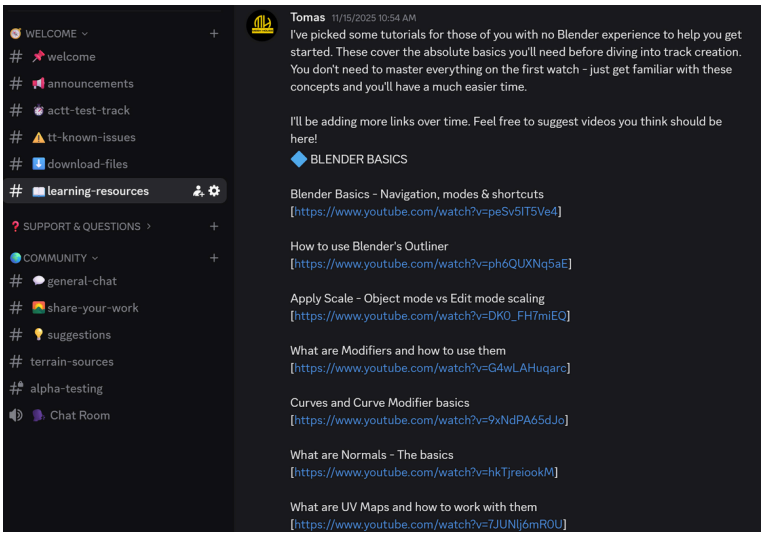

This document is universal for all packs. Your TrackTools files will have suffixes in the name based on your purchased pack and version (TrackTools_FULL_v2.1) - I'll be referencing to it like this: **TrackTools_[PACK]**.

What You'll Need

Before we begin, make sure you have:

- **Blender 4.5** (4.5.1 LTS recommended) - Older versions will crash instantly, newer version support is not guaranteed YET.
- **TrackTools files** (downloaded from your purchase link)
- **Basic Blender knowledge** (navigation, object selection, modifier basics, UV maps)

If you're completely new to Blender, check out the **#learning-resources channel on Discord** for beginner tutorials to get you started. It is assumed in my tutorials that you have at least the knowledge from these videos.

Installation Steps

Step 1: Download and Extract

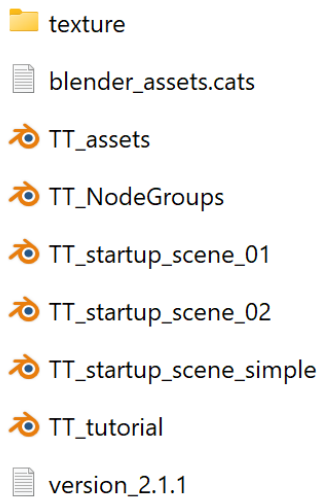

Download the latest version of **TrackTools_[PACK].zip.**
Download also the **Asset_Browser_Link_Addon.zip** and **tracktools_ac_exporter.zip**

Installable addons - can stay in the downloads folder as .zip for now.

Based on the purchased pack, you'll get one of these. Inside each .zip is a folder with the same name (without the version suffix) - these are the main TrackTools files.

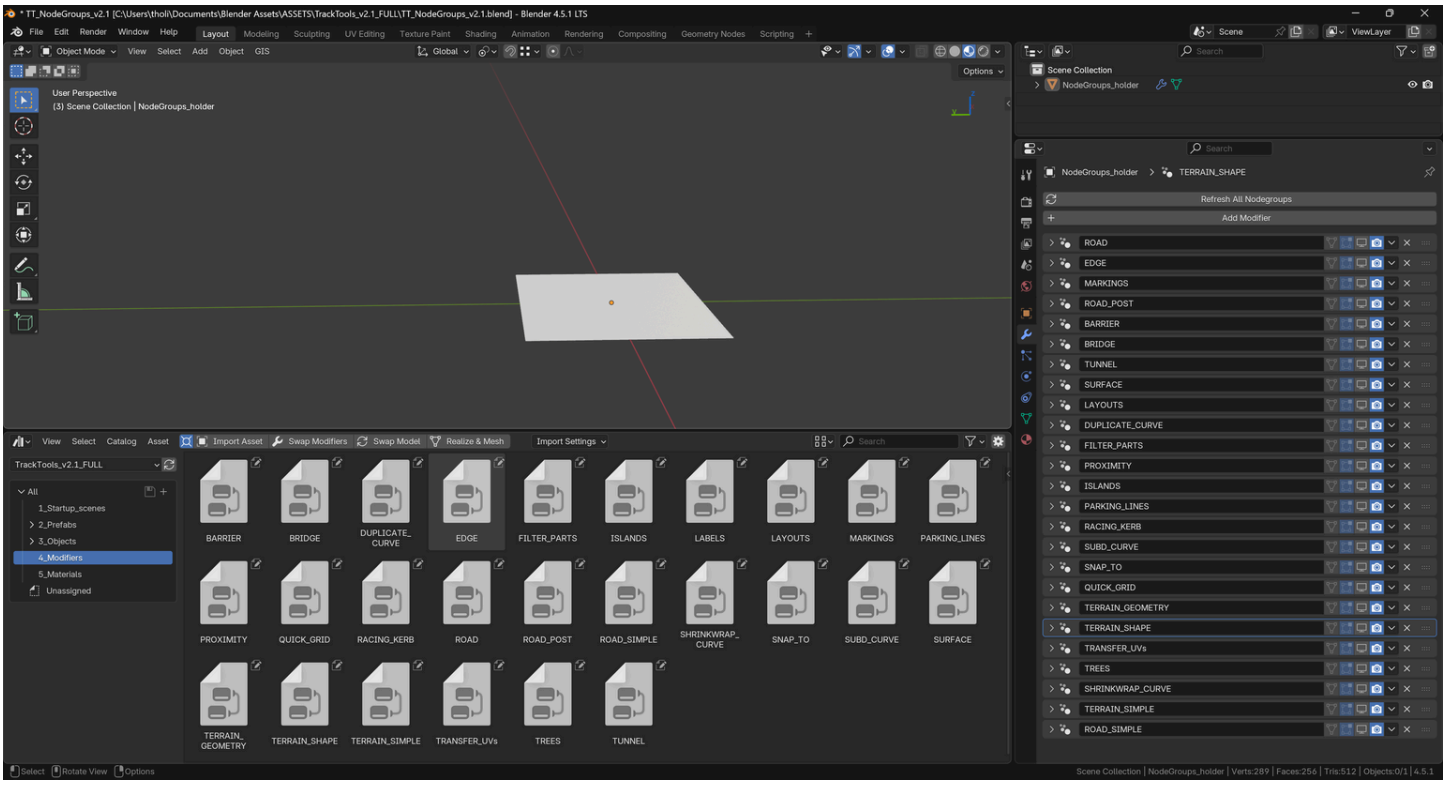

After extracting the **TrackTools_[PACK].zip** you should see these files:
(TT_startup_scene_01/02 are not part of the free pack).

All these files have relative paths set and are interconnected, so it's important that you don't move or rename anything inside this folder - only move the entire folder.

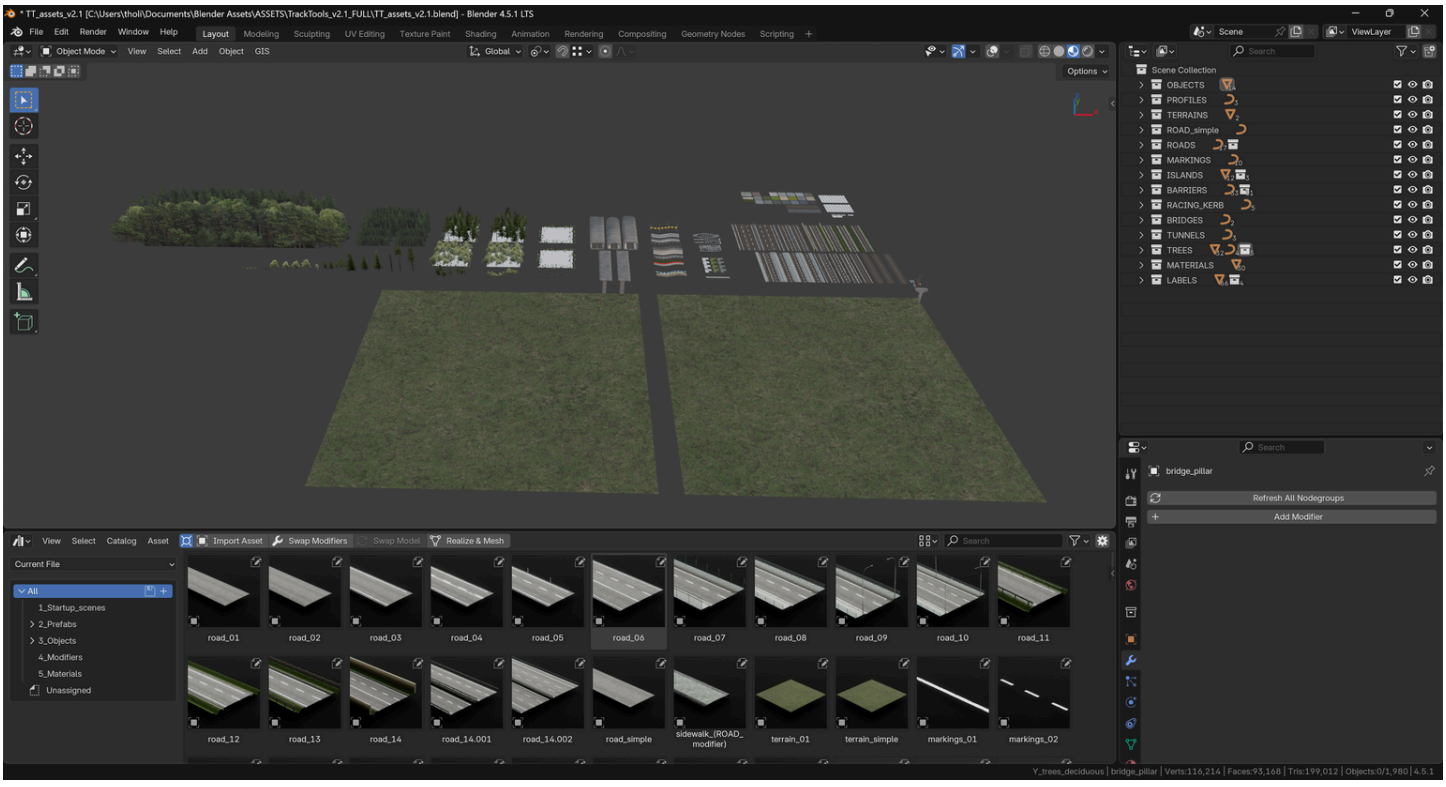

TT_NodeGroups

Contains all NodeGroups. Everywhere else the NodeGroups are linked from this file.

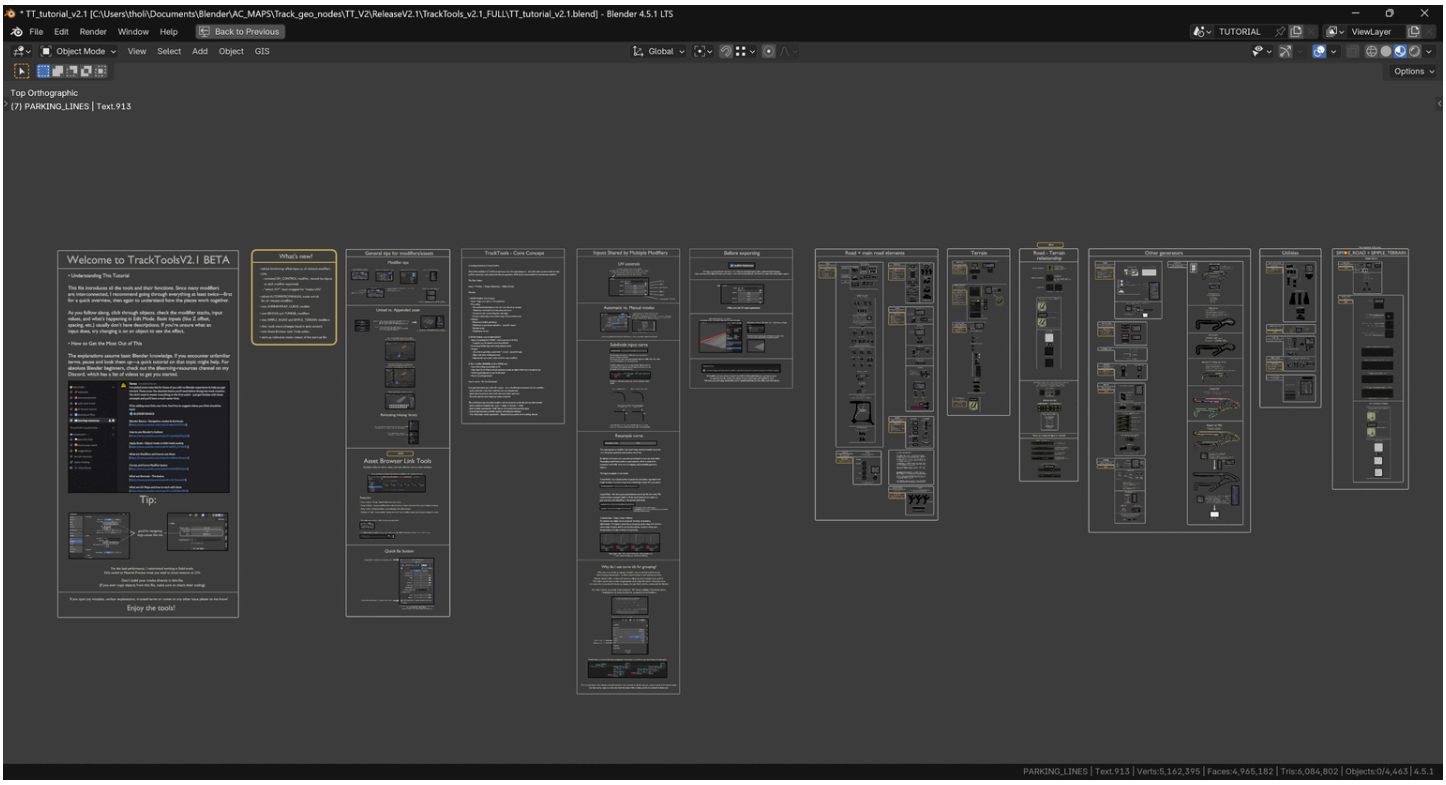

TT_assets

Contains all assets, materials and prefabs (objects with modifiers ready to be used).

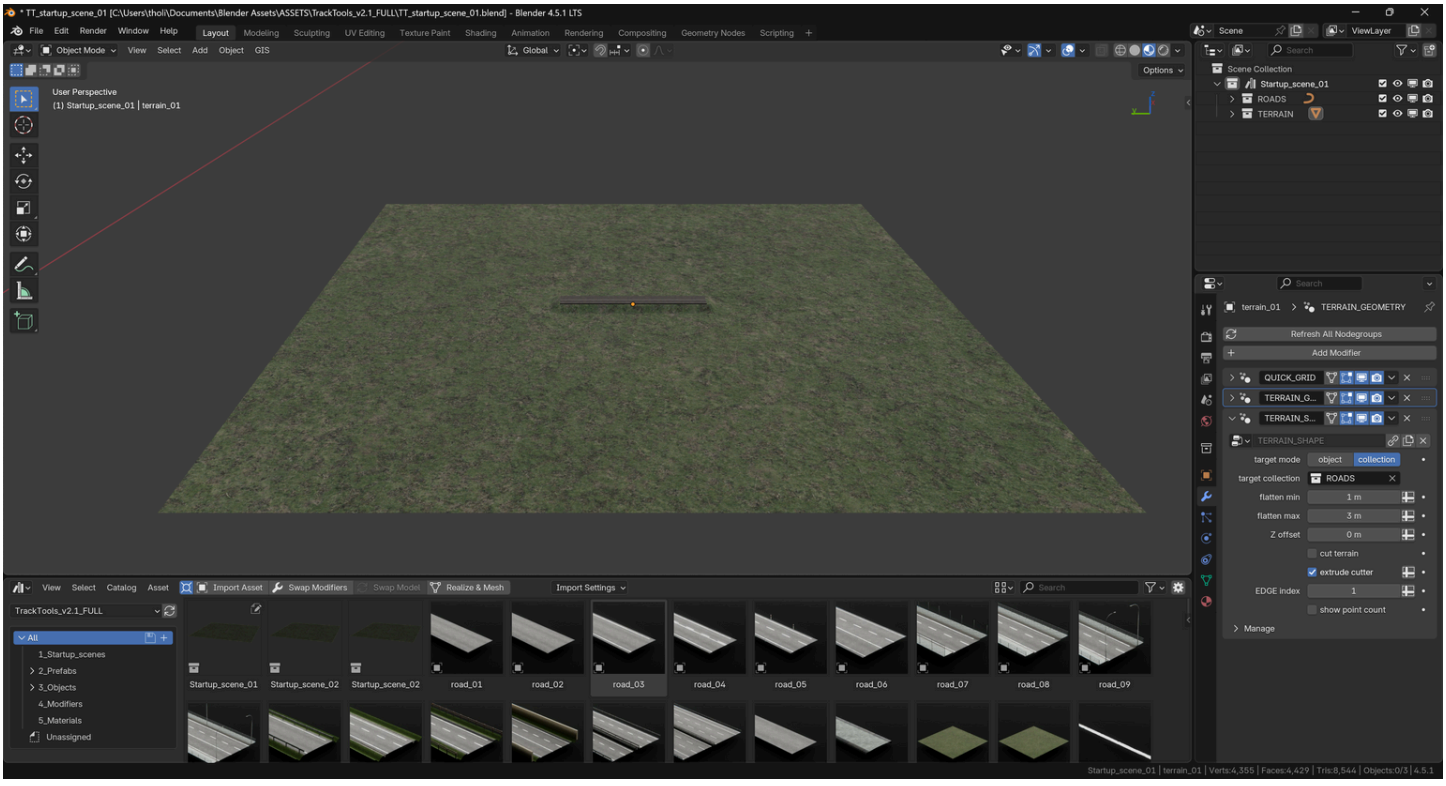

TT_tutorial

Interactive tutorial blendfile.

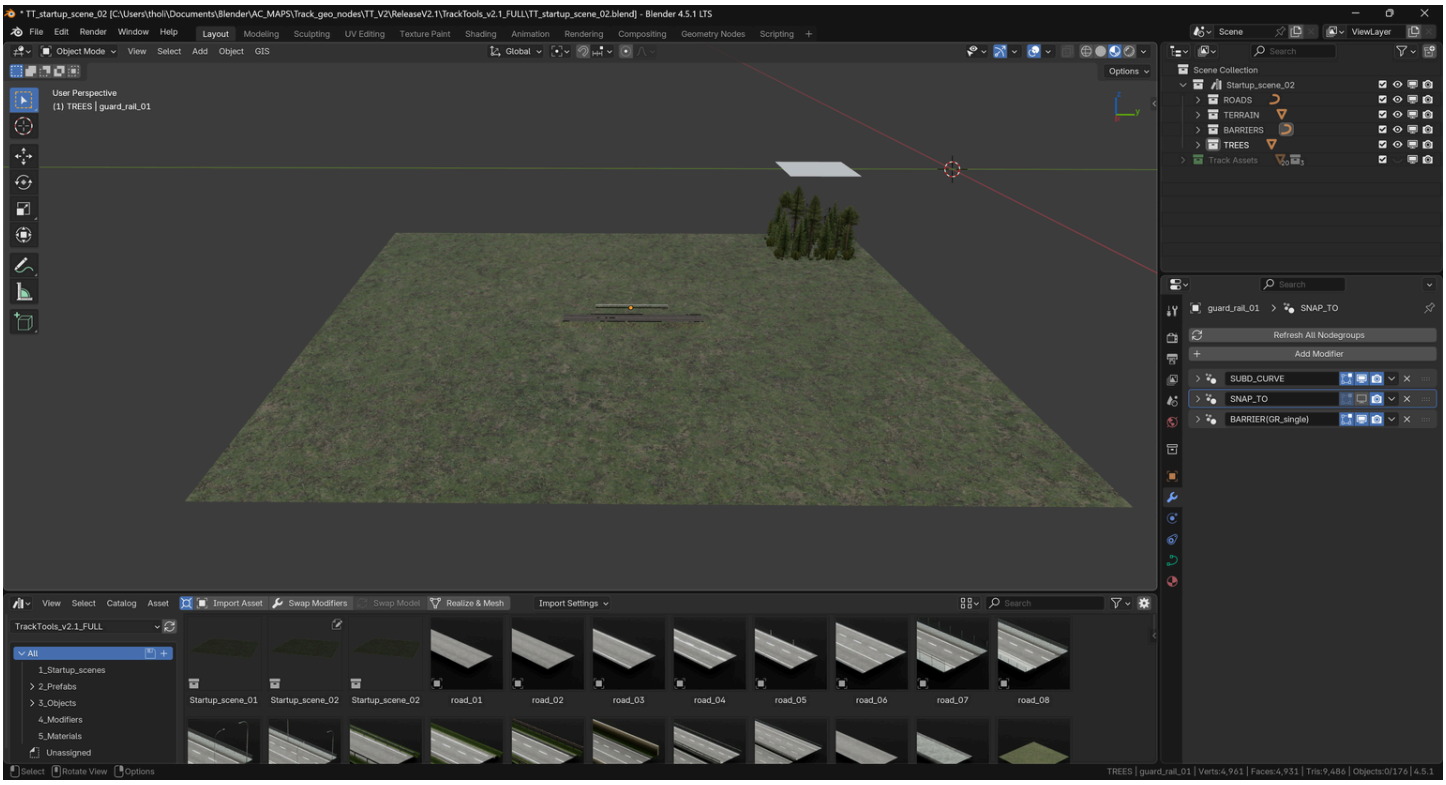

TT_startup_scene_01

Scene with road and terrain, already connected and ready to use.

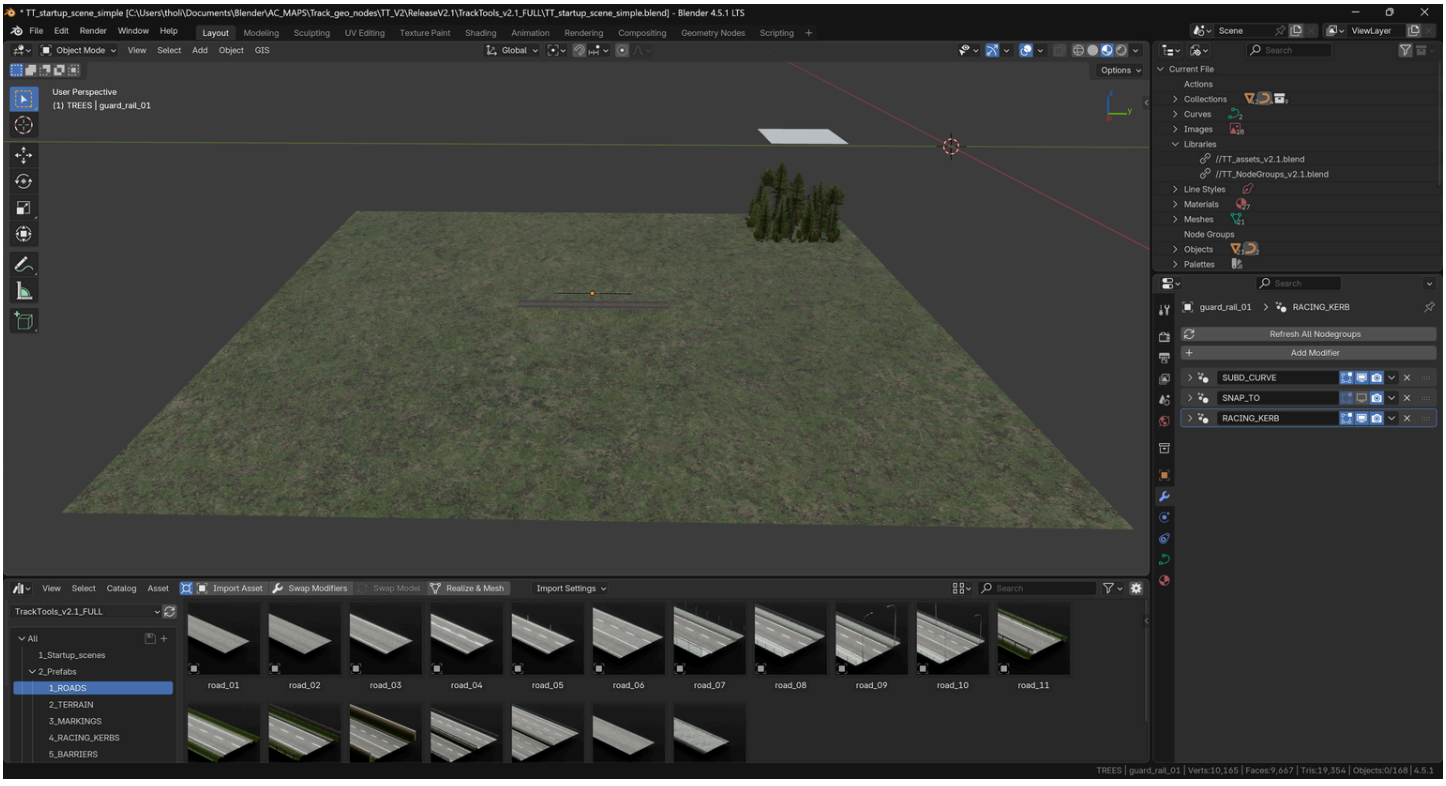

TT_startup_scene_02

Scene with road and terrain, trees and guardrail, already connected and ready to use.

TT_startup_scene_simple

Scene with simple road and terrain, trees and racing kerb, already connected and ready to use.

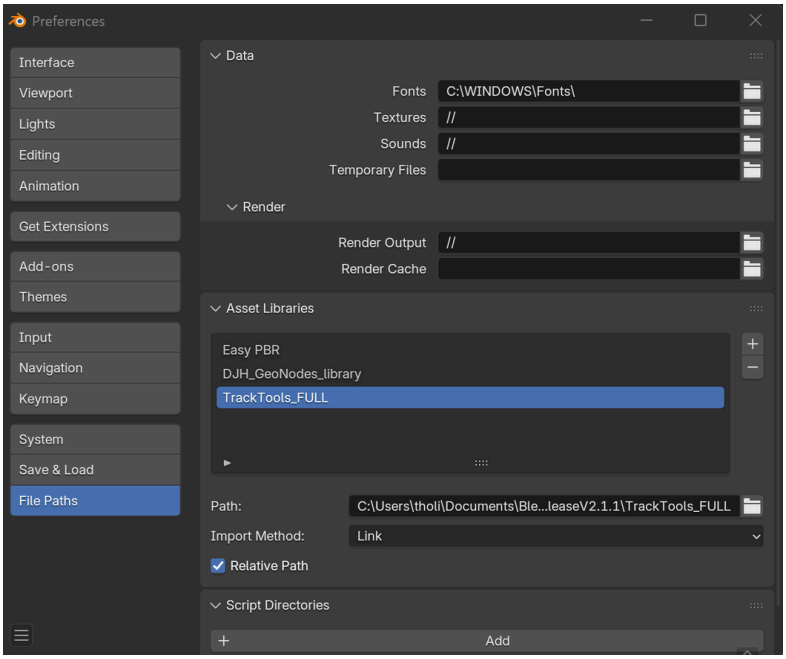

Step 2: Setting Up the Asset Library

Now let's make TrackTools available in your Asset Browser:

1. Open Blender Preferences

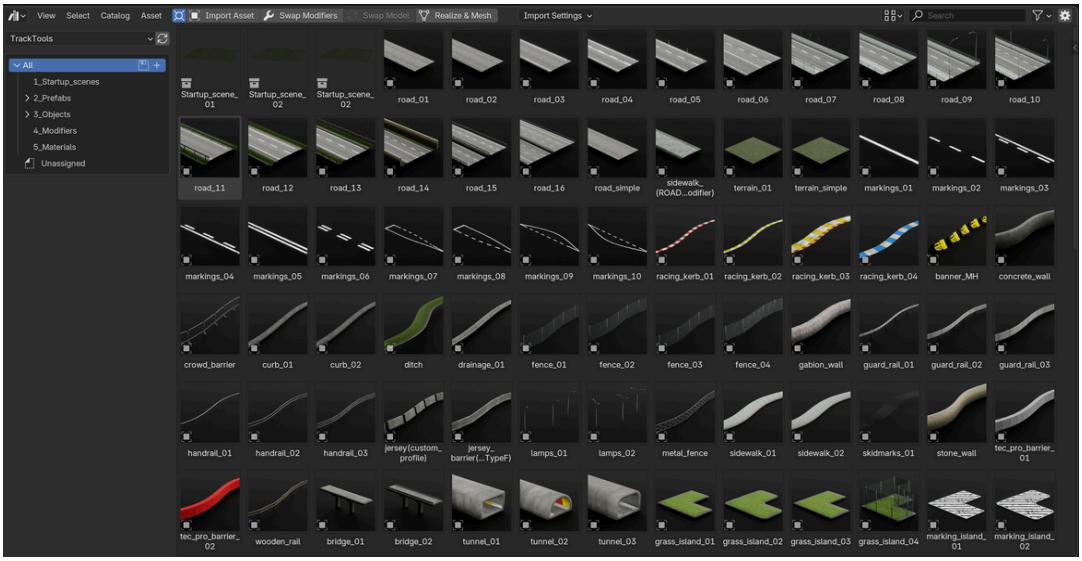

- Go to Edit > Preferences (or Blender > Preferences on Mac)
- Switch to the File Paths tab

2. Add TrackTools as a new library

- Look for the Asset Libraries section
- Click the + button to add a new asset library
- Click the folder icon and navigate to your extracted **TrackTools_[PACK]** folder
- Select the entire folder and confirm

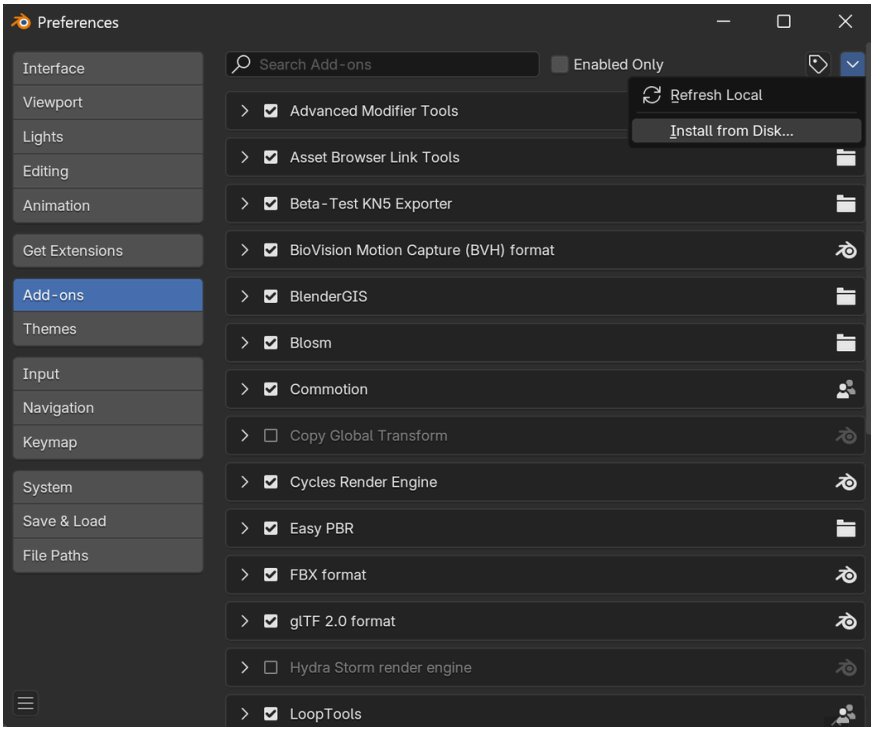

You should now see everything in your asset browser:

There might be less assets, depends on which pack you've downloaded.

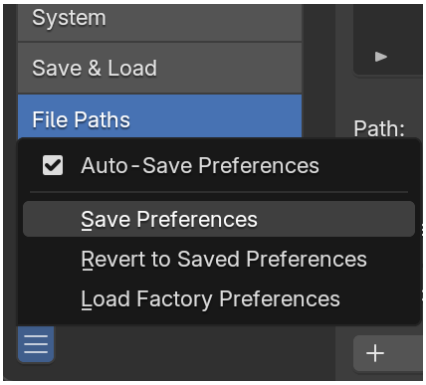

Step 3: Install Addons

1. Still in Preferences, navigate to the Add-ons tab

2. Install addons

- Click Install from disk and select **Asset_Browser_Link_Addon.zip**
- Do the same for **tracktools_ac_exporter.zip**
  (optional - only useful for Assetto Corsa 3DTrees and layouts export)
- Make sure both addons are enabled by checking their checkboxes
- Click Save Preferences

That's it! TrackTools is now installed and ready to use.

Now open the TT_tutorial_v2.1 and start experimenting!
